

Passion Project : Spice Kitchen

Spice Kitchen is a web app that lets two sets of people use the service: The Seller who wants to offer the service of selling home cooked meals occasionally to make some money on the side and the User/Buyers are the people who are busy working, who want to buy healthy authentic home cooked meals within the area. The Seller has to register by selecting the seller button where the seller will be allowed to add the menu and the type of food they are offering and the area where they live. The buyer can login in as a user and browse through the different sellers, based on the area they live in and have access to their menu and place order well in advance so that the seller can keep the food ready. This platform will connect those two people and provide a common ground as a marketplace without all the hassle and costs of creating their own business and going through the overhead expenses.

Included features are:

- Sellers can list the dishes they wish to sell, and at what price point.
- Buyers can keep track of their favorite seller
- Buyers can pick the dishes they wish to order, and then purchase
 - Specify a pickup time, quantity of dishes
 - Place the order well ahead of time
 - Gets notification when their dish is ready for pickup.

Minimum viable product:

- Sellers should be able to add & edit the dishes they are willing to sell.
- Buyers should be able to view all the sellers who are available.

I will do this web app using Javascript, HTML/CSS, Java and Spring/SpringBoot, MySQL.

JSON/HTTP will be used to communicate between Front-end and Back-end
